Maximum Marks	3 Marks

ACL MATRIX

ACL MATRIX – STANDARD LAPTOP PROCUREMENT

Role	Resource	Access	Scope
Requester	Service Catalog / Request	Create/Submit	Own request only
Approver	Approval / Request	Approve / Reject	Assigned request
Hardware Team	Catalog Task	Read/Update	Assigned hardware tasks
Flow / System User	Flow & Catalog Task	Create/Update	Automation scope
Admin	Configuration records	Configure / Maintain	Authorized administration

Note: This matrix is a project-design access model derived from the documented workflow. The source project does not specify actual ServiceNow ACL records.

Access Control Overview

The project document focuses on Flow Designer and Service Catalog automation and does not specify actual ServiceNow ACL records. The matrix above is therefore a project-design access model showing the logical permissions required by the workflow roles.

Role-Based Access

- Requester: create and view the request they submit.
- Approver: process the approval for the assigned request.
- Hardware Team: read and update Catalog Tasks assigned to the Hardware group.
- Flow / System User: create and update the task through automation.
- Admin: maintain configuration records and workflow setup.

ACL MATRIX DESCRIPTION

Requester Access

The requester needs access to select the Standard Laptop catalog item, submit the order, and view the progress of their request.

Approver Access

The approver needs access to the approval information associated with the request so that the request can be approved before task generation.

Hardware Team Access

The Hardware team needs access to the generated Catalog Task so that the laptop configuration work can be processed.

Automation Access

The Flow Designer process requires system-level ability to create and populate the Catalog Task as specified by the project configuration.

Administrative Access

Administrative access is required for maintaining Flow Designer, Service Catalog, and related configuration. This is a design-level requirement; the source project does not identify specific ACL names, conditions, or scripts.

Conclusion

The ACL model supports the principle that each role receives only the access needed to perform its part of the Standard Laptop procurement workflow.
